

Study Plan

I come from Timor-Leste, a developing country undergoing rapid digital transformation. Government institutions are increasingly adopting electronic systems for public administration, financial management, communication, and citizen services. As a graduate in Computer Science and a current government employee, I have witnessed how digital technologies improve efficiency and transparency. At the same time, I have observed growing cybersecurity vulnerabilities that threaten sensitive public data and national digital infrastructure. The limited number of trained cybersecurity specialists in Timor-Leste makes these risks particularly serious. These experiences have motivated me to pursue a Master's degree in Cybersecurity to strengthen my expertise and contribute to protecting my country's digital future. During my undergraduate studies, I developed solid foundations in programming, database systems, computer networks, operating systems, and system analysis. My professional experience in the government sector further deepened my understanding of the importance of safeguarding information systems. Government databases contain highly sensitive data, and any security breach could lead to service disruption, financial loss, and reduced public trust. I realized that cybersecurity is not only a technical discipline but also a matter of national stability and sustainable development. This realization strengthened my determination to specialize in cybersecurity at the graduate level. My academic interests include network security, applied cryptography, secure system architecture, intrusion detection systems, and cyber risk management. I am particularly interested in exploring artificial intelligence applications in cybersecurity, especially for anomaly detection and automated threat response. AI-based approaches can improve the efficiency and scalability of security systems, which is essential for developing countries with limited human resources. Through advanced study, I aim to combine theoretical knowledge with practical skills to design effective and sustainable cybersecurity solutions. I have chosen to pursue my Master's degree in China because of its global leadership in science, technology, and innovation. China has achieved significant progress in artificial intelligence, big data, cloud computing, and digital infrastructure security. Chinese universities provide strong academic environments, modern research facilities, and experienced faculty members. Studying in China will allow me to gain advanced knowledge and exposure to practical cybersecurity applications. After completing my Master's degree, I am committed to returning to Timor-Leste to continue serving in the government sector. I plan to apply advanced cybersecurity strategies to strengthen data protection, enhance institutional resilience, and support the development of national cybersecurity frameworks. Pursuing this degree in China represents both a professional objective and a personal commitment to contributing to a secure and sustainable digital future for my country.
